**Listing of Claims:**

---

- B1
- 1           1.       (currently amended): A system for patient monitoring using a  
2 reference baseline for use in automated patient care, comprising:  
3           a processing module processing one or more reference physiological  
4 measures relating to individual patient information recorded during an initial  
5 observation period by an implantable medical device into a reference baseline;  
6           an analysis module periodically receiving one or more updated  
7 physiological measures regularly recorded by the implantable medical device  
8 subsequent to the initial observation period; and  
9           a database module storing reference measures and one or more reference  
10 quality of life measures recorded by the individual patient during the initial  
11 observation period into a patient care record for the individual patient, and storing  
12 updated measures and one or more updated quality of life measures recorded by  
13 the individual patient subsequent to the initial observation period into the patient  
14 care record;  
15           a comparison module comparing the updated physiological measures to  
16 the reference physiological measures in the reference baseline for evaluating an  
17 absence, an onset, a progression, a regression, and a status quo of patient status to  
18 generate a patient status indicator identifying any such substantially non-  
19 conforming updated physiological measure; and  
20           a quality of life comparison submodule comparing the updated quality of  
21 life measures to the reference quality of life measures in the patient care record to  
22 generate the patient status indicator identifying any such substantially non-  
23 conforming updated quality of life measure.

- 1           2.       (original): A system according to Claim 1, further comprising:

2 a revision submodule analyzing the updated physiological measures  
3 relative to one or more further updated physiological measures to determine a  
4 revised patient status indicator.

1 3. (original): A system according to Claim 1, further comprising:  
2 a feedback module providing automated feedback based on the patient  
3 status indicator to the individual patient.

1 4. (currently amended): A system according to Claim 1, further  
2 comprising:

B1  
3 ~~a database module storing reference feedback recorded by the individual~~  
4 ~~patient during the initial observation period as reference feedback into patient care~~  
5 ~~record for the individual patient, and storing updated feedback recorded by the~~  
6 ~~individual patient subsequent to the initial observation period into the patient care~~  
7 ~~record; and~~

8 a feedback module comparing the updated feedback measures to the  
9 reference feedback measures in the patient care record to generate [[a]] the patient  
10 status indicator identifying any such substantially non-conforming updated  
11 feedback measures.

1 5. (original): A system according to Claim 1, further comprising:  
2 a reevaluation submodule processing one or more reference physiological  
3 measures relating to individual patient information recorded subsequent to the  
4 initial observation period into a revised reference baseline.

1 6. (canceled).

1 7. (original): A system according to Claim 1, further comprising:  
2 a monitoring submodule monitoring the individual patient while the  
3 individual patient is performing a prescribed set of timed physical stressors during  
4 the initial observation period.

1           8.       (original): A system according to Claim 7, wherein the prescribed  
2 set of activities are representative of substantially normal activity, further  
3 comprising:  
4           an activity submodule determining relative abnormal activity response  
5 based on any updated physiological measure identified as being substantially non-  
6 conforming to the corresponding reference physiological measure.

B1  
1           9.       (original): A system according to Claim 7, wherein the prescribed  
2 set of activities are representative of substantially normal exercise, further  
3 comprising:  
4           an activity submodule determining relative abnormal exercise response  
5 based on any updated physiological measure identified as being substantially non-  
6 conforming to the corresponding reference physiological measure.

1           10.      (currently amended): A method for patient monitoring using a  
2 reference baseline for use in automated patient care, comprising:  
3           processing one or more reference physiological measures relating to  
4 individual patient information recorded during an initial observation period by an  
5 implantable medical device into a reference baseline;  
6           periodically receiving one or more updated physiological measures  
7 regularly recorded by the implantable medical device subsequent to the initial  
8 observation period; ~~and~~  
9           storing reference measures and one or more reference quality of life  
10 measures recorded by the individual patient during the initial observation period  
11 into a patient care record for the individual patient;  
12           storing updated measures and one or more updated quality of life  
13 measures recorded by the individual patient subsequent to the initial observation  
14 period into the patient care record;  
15           comparing the updated physiological measures to the reference  
16 physiological measures in the reference baseline for evaluating an absence, an  
17 onset, a progression, a regression, and a status quo of patient status to generate a

18 patient status indicator identifying any such substantially non-conforming updated  
19 physiological measure; and  
20 comparing the updated quality of life measures to the reference quality of  
21 life measures in the patient care record to generate the patient status indicator  
22 identifying any such substantially non-conforming updated quality of life  
23 measure.

B1  
1 11. (original): A method according to Claim 10, further comprising:  
2 analyzing the updated physiological measures relative to one or more  
3 further updated physiological measures to determine a revised patient status  
4 indicator.

1 12. (original): A method according to Claim 10, further comprising:  
2 providing automated feedback based on the patient status indicator to the  
3 individual patient.

1 13. (currently amended): A method according to Claim 10, further  
2 comprising:  
3 ~~storing reference feedback recorded by the individual patient during the~~  
4 ~~initial observation period as reference feedback into patient care record for the~~  
5 ~~individual patient;~~  
6 ~~storing updated feedback recorded by the individual patient subsequent to~~  
7 ~~the initial observation period into the patient care record; and~~  
8 comparing the updated feedback measures to the reference feedback  
9 measures in the patient care record to generate [[a]] the patient status indicator  
10 identifying any such substantially non-conforming updated feedback measures.

1 14. (original): A method according to Claim 10, further comprising:  
2 processing one or more reference physiological measures relating to  
3 individual patient information recorded subsequent to the initial observation  
4 period into a revised reference baseline.

1 15. (canceled).

1           16.   (original): A method according to Claim 10, further comprising:  
2           monitoring the individual patient while the individual patient is  
3 performing a prescribed set of timed physical stressors during the initial  
4 observation period.

1           17.   (original): A method according to Claim 16, wherein the  
2 prescribed set of activities are representative of substantially normal activity,  
3 further comprising:  
4           determining relative abnormal activity response based on any updated  
5 physiological measure identified as being substantially non-conforming to the  
6 corresponding reference physiological measure.

1           18.   (original): A method according to Claim 16, wherein the  
2 prescribed set of activities are representative of substantially normal exercise,  
3 further comprising:  
4           determining relative abnormal exercise response based on any updated  
5 physiological measure identified as being substantially non-conforming to the  
6 corresponding reference physiological measure.

1           19.   (original): A computer-readable storage medium for a device  
2 holding code for performing the method according to Claims 10, 11, 12, 13, 14,  
3 15, 16, 17, or 18.

1           20.   (currently amended): A system for managing a reference baseline  
2 of patient information for use in automated patient care, comprising:  
3           a processing module processing one or more reference physiological  
4 measures regularly recorded by an implantable medical device during an initial  
5 observation period, each reference physiological measure being representative of  
6 at least one of measured or derived data;  
7           a database module periodically receiving one or more updated  
8 physiological measures recorded by the implantable medical device subsequent to

9 the initial observation period, each updated physiological measure being  
10 representative of at least one of measured or derived data;  
11 a database storing the reference physiological measures into a reference  
12 baseline in a patient care record, [[and]] storing the updated physiological  
13 measures into individual measures sets in the patient care record, storing one or  
14 more reference quality of life measures recorded during the initial observation  
15 period into the patient care record, and storing one or more updated quality of life  
16 measures recorded subsequent to the initial observation period into the patient  
17 care record; [[and]]  
18 a comparison module comparing the updated physiological measures in  
19 each individual measures set to the reference physiological measures in the  
20 reference baseline and identifying any such updated physiological measure  
21 substantially non-conforming to the corresponding reference physiological  
22 measure for evaluating an absence, an onset, a progression, a regression, and a  
23 status quo of patient status as part of a patient status indicator; and  
24 a quality of life comparison submodule comparing the updated quality of  
25 life measures to the reference quality of life measures in the patient care record  
26 and identifying any such updated quality of life measure substantially non-  
27 conforming to the corresponding reference quality of life measures as part of the  
28 patient status indicator.

B1  
1 21. (original): A system according to Claim 20, further comprising:  
2 an analysis module analyzing the updated physiological measures in each  
3 individual measures set in the patient care record to the updated physiological  
4 measures in another individual measures set to determine a revised patient status  
5 indicator.

1 22. (currently amended): A system according to Claim 20, further  
2 comprising:  
3 a feedback database submodule storing reference ~~feedback~~ measures  
4 recorded by the individual patient during the initial observation period as

5 reference ~~feedback~~ measures into the patient care record and storing updated  
6 ~~feedback~~ measures recorded by the individual patient subsequent to the initial  
7 observation period into the patient care record; and  
8 a feedback comparison submodule comparing the updated ~~feedback~~  
9 measures to the reference ~~feedback~~ measures in the patient care record and  
10 identifying any such updated ~~feedback~~ measures substantially non-conforming to  
11 the corresponding reference ~~feedback~~ measures as part of the patient status  
12 indicator.

B1  
1 23. (currently amended): A system according to Claim 20, further  
2 comprising:  
3 a reevaluation submodule processing one or more revised reference  
4 physiological measures recorded subsequent to the initial observation period; and  
5 the database storing the revised reference physiological measures into a  
6 revised reference baseline in [[a]] the patient care record.

1 24. (canceled).

1 25. (currently amended): A method for managing a reference baseline  
2 of patient information for use in automated patient care, comprising:  
3 processing one or more reference physiological measures regularly  
4 recorded by an implantable medical device during an initial observation period,  
5 each reference physiological measure being representative of at least one of  
6 measured or derived data;  
7 storing the reference physiological measures into a reference baseline in a  
8 patient care record;  
9 periodically receiving one or more updated physiological measures  
10 recorded by the implantable medical device subsequent to the initial observation  
11 period, each updated physiological measure being representative of at least one of  
12 measured or derived data;  
13 storing the updated physiological measures into individual measures sets  
14 in the patient care record; [[and]]

15 storing one or more reference quality of life measures recorded during the  
16 initial observation period into the patient care record for the individual patient;  
17 storing one or more updated quality of life measures recorded subsequent  
18 to the initial observation period into the patient care record;  
19 comparing the updated physiological measures in each individual  
20 measures set to the reference physiological measures in the reference baseline and  
21 identifying any such updated physiological measure substantially non-conforming  
22 to the corresponding reference physiological measure for evaluating an absence,  
23 an onset, a progression, a regression, and a status quo of patient status as part of a  
24 patient status indicator; and  
25 comparing the updated quality of life measures to the reference quality of  
26 life measures in the patient care record and identifying any such updated quality  
27 of life measure substantially non-conforming to the corresponding reference  
28 quality of life measures as part of the patient status indicator.

1 26. (original): A method according to Claim 25, further comprising:  
2 analyzing the updated physiological measures in each individual measures  
3 set in the patient care record to the updated physiological measures in another  
4 individual measures set to determine a revised patient status indicator.

1 27. (currently amended): A method according to Claim 25, further  
2 comprising:  
3 storing reference ~~feedback~~ measures recorded by the individual patient  
4 during the initial observation period as reference ~~feedback~~ measures into the  
5 patient care record;  
6 storing updated ~~feedback~~ measures recorded by the individual patient  
7 subsequent to the initial observation period into the patient care record; and  
8 comparing the updated ~~feedback~~ measures to the reference ~~feedback~~  
9 measures in the patient care record and identifying any such updated ~~feedback~~  
10 measures substantially non-conforming to the corresponding reference ~~feedback~~  
11 measures as part of the patient status indicator.

B1  
1        28.    (currently amended): A method according to Claim 25, further  
2    comprising:  
3        processing one or more revised reference physiological measures recorded  
4    subsequent to the initial observation period; and  
5        storing the revised reference physiological measures into a revised  
6    reference baseline in [[a]] the patient care record.

1        29.    (canceled).

1        30.    (original): A computer-readable storage medium for a device  
2    holding code for performing the method according to Claims 25, 26, 27, 28, or 29.

---
